

**COMP.SE.140: 21.11.2023**

# Course matters

- Information about the CI-capable GitLab is out
  - Please read carefully
  - Send questions
  - Next version TBD
- Grading of the communication exercise has been started
- Next weeks event is still under planning

# Course status

SISU signups	108
Plus signups	150
Docker/compose exercise	86
Communication exercise	69
Ansible exercise	29
Project	1

# Master thesis in a research project?

- We may have options starting ~January
- Possible topics
  - IoT and Edge computing
  - Data management systems
  - Declarative programming
  - Requirements traceability
- Expected competences
  - Strong software skills
  - Analytical thinking
  - Both independent and group work
  - Writing in English

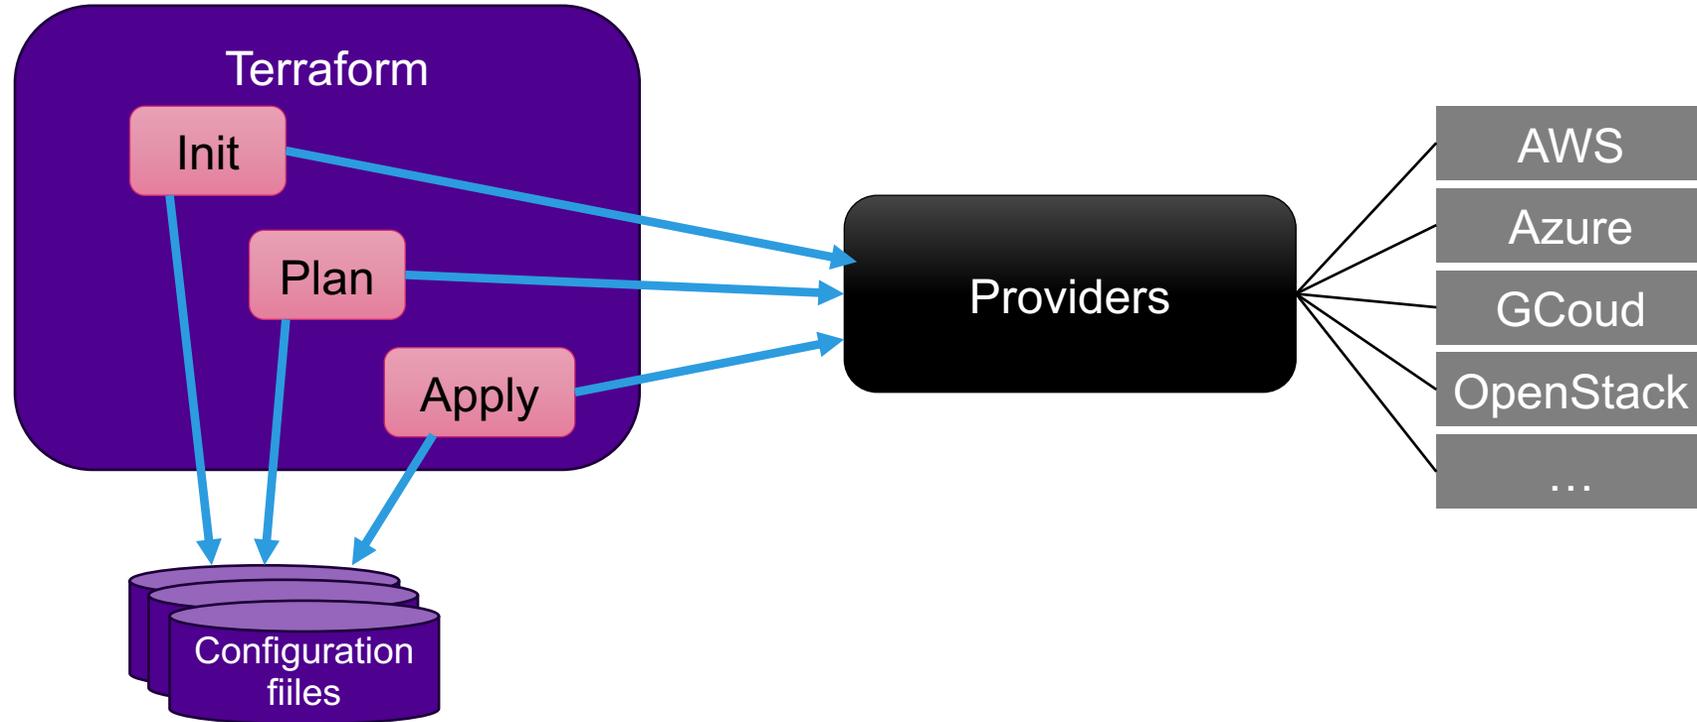

# Automation includes

- Building
  - > no command-line tools needed
- Testing
  - > run frequently
- Other quality analysis
  - > less manual inspection needed;
- Deployment
  - > VMs and containers created automatically
  - > configuration management
- Database tools
  - > initialization
  - > management
- Scaling

# Terraform

- An IaC tool to build infrastructure
  - Virtual machines
  - Storage
  - Network
- Declarative approach, too.
  - User writes a specification of the target state
- Pluggable architecture
  - Can have providers for AWS, Azure, gCloud, Open Stack ...
- Code – (plan – )apply

# Terraform

example.tf

```
terraform {
  required_providers {
    aws = {
      source = "hashicorp/aws"
      version = "~> 2.70"
    }
  }
}

provider "aws" {
  profile = "default"
  region = "us-west-2"
}

resource "aws_instance" "example" {
  ami = "ami-830c94e3"
  instance_type = "t2.micro"
}
```

```
$ terraform show
# aws_instance.example:
resource "aws_instance" "example" {
  ami              = "ami-830c94e3"
  arn              = "arn:aws:ec2:us-east-1:130490850807:instance/i-0bbf06244e44211d1"
  associate_public_ip_address = true
  availability_zone = "us-west-2"
  cpu_core_count   = 1
  cpu_threads_per_core = 1

# Ansible vs Terraform?

# ChatGPT and DevOps?

# Example

**Kari:** Can you provide me with terraform configuration file to create two small linux virtual machines connected with a private virtual network in AWS?

**ChatGPT:** Certainly! Below is an example Terraform configuration file (usually named main.tf) that you can use to create two small Linux virtual machines (EC2 instances) connected with a private virtual network (VPC) in AWS. This example assumes you want to use the Amazon Linux 2 AMI and a t2.micro instance type for simplicity.

Make sure to replace the placeholder values with your actual AWS region, availability zone, AMI ID, key pair name, etc. You can find the appropriate AMI ID for your region on the AWS console or using AWS CLI commands.

After creating the Terraform configuration file, you can run the following Terraform commands in the terminal:

```
terraform init
terraform apply
```

**Kari:** How about the same configuration for Azure?

**ChatGPT:** Certainly! Below is an example Terraform configuration file (usually named main.tf) to create two small Linux virtual machines connected with a private virtual network in Microsoft Azure. This example uses Ubuntu Server 20.04 LTS for the virtual machines.

Make sure to replace the placeholder values with your actual Azure region, admin username, admin password, etc.

After creating the Terraform configuration file, you can run the following Terraform commands in the terminal:

```
# Configure the AWS provider
provider "aws" {
  region = "your_aws_region" # Replace with
                             your desired AWS region
}

# Create a Virtual Private Cloud (VPC)
resource "aws_vpc" "my_vpc" {
  cidr_block = "10.0.0.0/16"
}

# Create a subnet within the VPC
resource "aws_subnet" "my_subnet" {
  vpc_id            =
aws_vpc.my_vpc.id
  cidr_block        = "10.0.1.0/24"
  availability_zone =
"your_preferred_availability_zone" # Replace
with your desired availability zone
}
```

```
# Configure the Azure provider
provider "azurerm" {
  features = {}
}

# Create a resource group
resource "azurerm_resource_group"
"my_resource_group" {
  name          = "myResourceGroup"
  location      = "your_azure_region" # Replace with
your desired Azure region
}

# Create a virtual network
resource "azurerm_virtual_network" "my_vnet" {
  name                = "myVNet"
  resource_group_name =
azurerm_resource_group.my_resource_group.name
  address_space       = ["10.0.0.0/16"]
}

# Create a subnet within the virtual network
resource "azurerm_subnet" "my_subnet" {
  name                = "mySubnet"
  resource_group_name =
azurerm_resource_group.my_resource_group.name
  virtual_network_name =
azurerm_virtual_network.my_vnet.name
  address_prefixes    = ["10.0.1.0/24"]
}
```

```
# Create a security group for the instances
resource "aws_security_group"
"my_security_group" {
  name          = "my_security_group"
  description   = "Allow SSH inbound traffic"
